

Synovis MCA Adds Innovative DermaClose Wound Closure Device to Product Portfolio

Today Synovis Micro Companies Alliance—a wholly owned subsidiary of Baxter International—announced the addition of the DermaClose® Continuous External Tissue Expander to its portfolio of innovative surgical care products. DermaClose is the only controlled force, automatic (self-tightening) continuous external tissue expander that safely and effectively facilitates rapid tissue movement to reduce or re-approximate wounds.

DermaClose is indicated for use in reducing or assisting with the closure of full-thickness wounds of the skin, can assist with split thickness skin grafts, high tension closures, delayed primary closure and wound size reduction and offloading of suture tension.

“DermaClose provides a proven, innovative alternative to skin grafts, complicated flaps, prolonged secondary healing or donor site closure,” said Wil Boren, president, Advanced Surgery, Baxter. “We look forward to speaking with surgeons about how they can use DermaClose with their patients to reduce time to closure, improve outcomes and ultimately give patients a better surgical experience.”

Customers should continue to contact their existing DermaClose representative for product information.
